Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	1 of 7

1. Purpose & Overview

This Career Development Plan (CDP) defines the structured 24-month training pathway for the Engineer Trainee (Process Engineer) role at Specialty RTP, Inc. The plan is designed to develop a technically competent, cross-functional contributor who understands the complete manufacturing cycle — from raw material receipt through field installation — and who can progress into a process improvement and ultimately a design/planning capacity within the organization.

The CDP is organized into three progressive phases:

- Phase 1 (Months 1–6) — Shop Floor Immersion: hands-on rotation across all production stations, equipment maintenance, quality/testing functions, and inventory/supply chain operations, culminating in exposure to field installation activities.
- Phase 2 (Months 6–18) — Process Improvement: office-based project work focused on identifying, planning, and implementing shop-floor and equipment improvement initiatives, working directly with the VP Production & Engineering.
- Phase 3 (Months 18–24) — Design & Technical Planning: development in product/process design principles, engineering calculations, technical planning, and cross-functional coordination in support of the CTO and VP Production & Engineering.

Progression between phases is milestone-based, not solely time-based. The minimum duration for Phase 1 is 6 months (Phases 1A) with a recommended full 6-12-month tenure on the shop floor before transitioning to Phase 2. Advancement is subject to demonstrated competency and management assessment.

2. Candidate Profile & Role Context

The Engineer Trainee enters SRTP at operator level to ensure equitable onboarding relative to existing production team members and to provide unmediated exposure to shop floor operations. The role is not a traditional graduate program — it is a deliberate development track designed to build genuine shop floor credibility before transitioning the individual to office-based engineering functions.

Key context for this role:

- The individual brings academic credentials (chemistry/engineering background) but limited industrial manufacturing experience. The first phase prioritizes practical, hands-on competency over theoretical application.
- Compensation trajectory reflects development milestones to retain the individual through the program. A review is recommended at the 6-month and 12-month marks.
- The 12-hour shift cycle and consecutive-day production schedule represent a significant physical and motivational demand. Proactive engagement, clear progression signals, and early recognition of capability are essential retention tools.
- The VP Production & Engineering serves as the primary sponsor and guide throughout the full 36-month program. Daily oversight during Phase 1 sits with the Manufacturing Manager and the relevant Senior Station Lead.

3. Program Timeline Overview

	Career Development Plan		Doc No:	CDP-001
			Rev Date:	5/13/2026
Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	2 of 7

Phase	Timeframe	Primary Location	Reporting Focus	Key Output
Phase 1A — Shop Foundations	Months 1–3	Production Floor	Manufacturing Manager / VP Production & Engineering	Competency in Baseline, Braidline, Coverline operations; equipment familiarity
Phase 1B — Full Production Cycle + Field	Months 3–6	Production Floor + Field	Manufacturing Manager / VP Production & Engineering	Quality/testing proficiency; inventory & supply chain literacy; minimum 1 field install
Phase 2 — Process Improvement	Months 6–18	Office + Shop Floor	VP Production & Engineering	Documented improvement projects; project plan portfolio; shop efficiency metrics
Phase 3 — Design, Planning & Technical	Months 18–24	Office + Cross-functional	CTO / VP Production & Engineering	Technical design contributions; planning documents; readiness for senior role

4. Phase 1 – Shop Floor Immersion (Months 1-6)

4.1. Phase 1A — Core Station Rotations (Months 1–3)

PHASE 1A	Core Station Rotations	Months 1–3 Production Floor
Objective	Build hands-on working knowledge of all three primary production stages and supporting maintenance activities. Develop the foundational shop floor literacy required to credibly engage in process improvement work in Phase 2.	
Key Activities	- Baseline Station — minimum 3 weeks: extrusion process parameters, line speed, material handling, dimensional inspection using calipers and Pi tape, production record completion, shift handover process - Braidline Station — minimum 3 weeks: braiding angle and fiber tension, overlap/coverage requirements, fiber count verification, in-process inspection per QWI QC 004, record completion - Coverline Station — minimum 3 weeks: cover extrusion temperatures, wall thickness measurement (PosiTector UTG), adhesion requirements, in-process inspection per QWI QC 005 - Quality & Testing Lab — minimum 2 weeks: short-term burst test (QWI QC 001), hydrostatic testing (QWI QC 002), calibration and measurement tools, NCR process and RED-tag segregation procedure - Equipment Maintenance — minimum 1 weeks: work alongside Maintenance Lead to understand PM schedules, fault logging, basic electrical/mechanical troubleshooting for each station's equipment - QMS Orientation — complete quality policy awareness, document control, nonconforming product procedure, and HSE safety training within first 30 days - Morning production meetings — attend daily, observe how production schedule, quality holds, and resource issues are communicated across shifts	
Completion Criteria	- Can set up, operate, and complete production records at all three stations without constant supervision - Understands in-process inspection hold points and the NCR/RED-tag process

			Rev Date:	5/13/2026
Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	3 of 7

PHASE 1A	Core Station Rotations	Months 1–3 Production Floor
	• Can identify and report equipment fault conditions for each station • Has completed QMS onboarding training and signed competency acknowledgements • Has demonstrated ability to work safely and comply with all QHSE requirements	

4.2. Phase 1B — Full Cycle, Field & Supply Chain (Months 3–6)

PHASE 1B	Full Production Cycle, Field Exposure & Supply Chain	Months 3–6 Floor Field
Objective	Deepen production competency across all stations, gain exposure to quality/testing leadership functions, complete supply chain and inventory literacy, and participate in at least one field installation to understand the end-to-end product lifecycle.	
Key Activities	• Continued station rotations — operate across all three stations with increasing independence; take lead responsibility for shift-level tasks under Senior Lead supervision • Quality & Testing — deeper involvement: review and verify inspection records; assist Quality & HSE Manager in audit-readiness tasks; understand API Spec 15S inspection requirements in context • Swaging & Fitting — learn and demonstrate the swaging process per quality work instructions; understand fitting inspection criteria and documentation • Field Installation — accompany at least one field installation crew; observe fitting/connection procedures, pressure test protocols, and site documentation practices • Inventory & Receiving — rotate through Shipping & Receiving and raw materials store: understand receiving inspection, material identification and traceability, storage requirements, lot control, and the inventory system (• Procurement basics — sit with Procurement Specialist: understand the purchase requisition and PO process, approved vendor list, lead time management, and material specs for key RTP inputs • Process gap identification — begin an informal log of observed inefficiencies, equipment issues, and improvement opportunities on the shop floor; review with VP Production & Engineering monthly • Improvement project scoping — with VP Production & Engineering, select one or two improvement opportunities from the gap log to develop into formal project proposals as a bridge into Phase 2	
Completion Criteria	• Has participated in at least one field installation and can describe the end-to-end product lifecycle from raw material to installed pipe • Can independently complete swaging process per QWI and pass quality inspection • Demonstrates working knowledge of receiving, material traceability, and inventory management procedures • Has produced a documented improvement opportunity log with at least two scoped proposals ready for Phase 2 • Compensation review conducted at Month 12; trajectory toward entry-level engineering rate confirmed or adjusted

5. Phase 2 — Process Improvement (Months 6–18)

PHASE 2	Office-Based Process Improvement & Project Management	Months 6–18 Office + Floor
Objective	Transition from operator-level contributor to a hybrid engineering function. Leverage shop floor knowledge to identify, plan, and implement measurable process and equipment improvements. Develop project management capability in a real operational context. Maintain shop floor presence during implementation phases.	
Key Activities	- Process improvement project ownership — work with VP Production & Engineering to maintain a prioritized improvement project list; own scoping, planning, sourcing, and execution for assigned projects - Production scheduling awareness — understand how production plan creates windows (equipment downtime, transition gaps) that determine when improvement projects can be implemented; use these windows proactively - Equipment improvement projects — examples include: dry air systems, hose/connection organization on coverline, tooling standardization, housekeeping/5S systems, test bench upgrades - Documentation — prepare project proposals, cost-benefit summaries, implementation plans, and post-completion reviews in a consistent, professional format for review by VP Production & Engineering and CEO - Technical writing development — begin contributing to or updating work instructions, equipment setup checklists, and process parameter records under QMS oversight - Sourcing and procurement coordination — manage vendor contact, quote comparison, and supply coordination for assigned improvement projects in conjunction with Procurement Specialist - Materials science foundation — structured self-study and mentored sessions with CTO on pipe material types, RTP design principles, force/pressure analysis, and relevant standards (API Spec 15S, relevant ASTM methods) - Regular review cadence — monthly structured review with VP Production & Engineering; project status, blockers, and development feedback; quarterly summary to CEO	
Completion Criteria	- Has completed and documented at least two measurable improvement projects with before/after performance data - Has produced professionally formatted project plans and completion reports suitable for executive review - Demonstrates ability to plan and schedule project activities around the production schedule without disrupting output - Has begun structured study in materials science and pipe design principles; can explain basic RTP design rationale - Compensation review conducted; benchmarked against junior process engineer market rate	

6. Phase 3 — Design, Planning & Technical Development (Months 18–24)

			Rev Date:	5/13/2026
Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	5 of 7

PHASE 3	Technical Design Contribution, Planning & Advanced Engineering	Months 18–24 Office + Cross-Functional
Objective	Develop as a credible technical contributor in product design, process engineering, and capital planning. Support CTO and VP Production & Engineering in design activities, process validation, and engineering documentation. Prepare for transition to a full process/design engineering role.	
Key Activities	- Product design exposure — work with CTO on RTP product specifications, design calculations, qualification testing requirements under API Spec 15S, and management of change (MOC) documentation - Process validation — contribute to or own documentation for process validation activities (QP-021 and associated work instructions WI-BL-001, WI-BR-001, WI-CL-001) - Capital project development — progress high-priority improvement proposals from Phase 2 into formal capital project submissions including ROI analysis, equipment specifications, and vendor evaluation - Technical specification writing — draft or update engineering specs, TDS/MDS documents, and product data sheets under CTO review - Cross-functional planning — participate in production planning, order execution, and customer delivery coordination (QP-037) in support of VP Production & Engineering and Projects Manager - Advanced materials study — continue mentored development with CTO on advanced RTP design principles, material compatibility, failure modes, and pressure/temperature rating methodology - Field technical role assessment — based on field exposure in Phase 1B and subsequent development, assess aptitude and interest for a field technical leadership function - Leadership and communication — begin presenting improvement results and technical proposals at management level; develop written and verbal communication appropriate for client-facing and API audit contexts	
Completion Criteria	- Can contribute meaningfully to product design reviews and process validation documentation - Has produced at least one capital project proposal accepted for implementation by the CEO/VP - Can explain SRTP's RTP design rationale, material selection criteria, and API Spec 15S qualification requirements - Is assessed and confirmed as ready for a formal Process/Design Engineer or equivalent designation - Performance and compensation review conducted; pathway to senior role defined	

7. Competency Development Matrix

The matrix below tracks development trajectory across key competency domains throughout the three phases. Legend: ✓ Develop = active skill-building through OJT/structured activity | ✓ Apply = applying competency independently | ✓ Advance = deepening and leading | ✓ Expert = teaching-level proficiency and ownership.

Competency Domain	Phase 1A Shop Foundations (Mo 1–3)	Phase 1B Full Cycle (Mo 3–6)	Phase 2 Process Improvement (Mo 6–18)	Phase 3 Design & Planning (Mo 18–24)
Production — Baseline Operations	✓ Develop		✓ Apply	

	Career Development Plan		Doc No:	CDP-001
			Rev Date:	5/13/2026
Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	6 of 7

Competency Domain	Phase 1A Shop Foundations (Mo 1–3)	Phase 1B Full Cycle (Mo 3–6)	Phase 2 Process Improvement (Mo 6–18)	Phase 3 Design & Planning (Mo 18–24)
Production — Braidline Operations	✓ Develop		✓ Apply	
Production — Coverline Operations	✓ Develop		✓ Apply	
Production — Testing & QC	✓ Develop	✓ Advance	✓ Apply	
Maintenance — Mechanical / Electrical	✓ Develop	✓ Advance		
Quality System & NCR Process	✓ Awareness	✓ Develop	✓ Apply	✓ Expert
Inventory, Receiving & Material Handling		✓ Develop	✓ Apply	
Procurement & Supply Chain Basics		✓ Develop	✓ Apply	
Field Installation — Swaging & Assembly		✓ Develop	✓ Apply	
Process Improvement / Lean Methods			✓ Develop	✓ Apply
Project Planning & Scheduling			✓ Develop	✓ Advance
Materials Science & Pipe Design Principles		✓ Awareness	✓ Develop	✓ Advance
Technical Documentation & Reporting	✓ Awareness	✓ Develop	✓ Apply	✓ Expert
Capital Project Identification & Justification			✓ Develop	✓ Advance

8. Retention Framework & Compensation Trajectory

The following framework is recommended to retain high-potential Engineer Trainees through the full 24-month program.

Review Point	Timing	Assessment Basis	Compensation Target / Action
Phase 1A Review	Month 3	Phase 1A completion criteria met; demonstrated quality and reliability	First merit increase toward entry-level technician rate; formal performance discussion
Phase 1 Completion Review	Month 6	Full Phase 1 criteria met; field install completed; improvement proposals scoped	Benchmark against entry-level process/chemical engineer market rate in Texas oil & gas sector
Phase 2 Mid-Review	Month 12	At least one improvement project completed and documented	Project completion bonus or additional merit increase; formal title clarification if warranted
Phase 2 Completion Review	Month 18	Two completed projects; technical writing demonstrated; design study underway	Full market-rate alignment for junior process/design engineer; formal role designation

	Career Development Plan		Doc No:	CDP-001
			Rev Date:	5/13/2026
Engineer Trainee (Process Engineer)			Rev #:	01
Process Owner: VE Prod & Eng	Review: HR	Approval: CEO	Page #:	7 of 7

Review Point	Timing	Assessment Basis	Compensation Target / Action
Phase 3 Completion Review	Month 24	Full Phase 3 criteria; capital project and design contributions confirmed	Senior-level role pathway defined; title promotion; compensation at or above market for role

9. Program Governance & Review Cadence

Review Type	Frequency	Participants	Purpose
Weekly Check-In	Weekly	Trainee + Direct Supervisor (Manufacturing Manager during Phase 1)	Workload, concerns, learning observations
Monthly Development Review	Monthly	Trainee + VP Production & Engineering	CDP progress, skill gaps, next rotation or project planning
Phase Gate Review	At each phase transition	Trainee + VP Production & Engineering + CEO	Formal phase completion assessment; compensation review; next phase confirmation
Quarterly Summary to CEO	Quarterly	VP Production & Engineering (report to CEO)	Program health, milestone status, compensation trajectory
HR Documentation	Each review point	Truart HR (Shari) — for file	Signed CDP updates, competency records, training logs retained in personnel file

10. Revision History

Rev	Date	Author	Description of Change
